

New Jetty Infrastructure for Vopak Korea

Beginning of April Vopak Terminals Korea (VTK) commissioned its new berth infrastructure on pier number 6. After reaching an agreement with the Ulsan port authorities about the dedicated use of pier 6 for VTK's Terminal 2 in 2003, this event marked another big milestone in further improving the vessel turnaround time.

Until recently VTK worked with a flexible piping and hose system to connect the vessel manifold to the pier's manifold pit some 100 meters away. With the installation of a fixed pipe rack with 17 stainless steel pipes and manifolds VTK expects to reduce the infrastructure preparation and berthing time.

New permanent jettylines at pier 6 in Ulsan
